

Tutorial 1 Solution

Introduction to Linux Commands

Table of commands (commands are case sensitive):

pwd	Display path of working directory name.
cd	Change directory.
cd ..	Move to previous folder/ directory
ls	List contents of directory.
ls -l	Long list of contents of directory (shows more information for owner of files).
ls -lht	What changes observed than the previous command?
info pwd	Display information on the pwd command.
mkdir folder/ directory	Make a new directory called folder/ directory.
echo Welcome	Output Welcome.
> file_1.txt	Create a new empty file called file_1.txt in the current working directory.
echo file_2 > file_1.txt	Redirect the output from the echo command to a file called file_1.txt .
cat file_1.txt	Output the contents of the file_1.txt file.
cp file_1.txt file_2.txt	Create a copy of the file named file_1.txt . The copied file will be called file_2.txt .
mv file_1.txt file_11.txt	Move the file named file_1.txt to a file named as file_11.txt .
rm file_1.txt	Delete the file named file_1.txt .
rm -rf folder_name	Delete the folder name.
chmod	chmod is the command and system call used to change the access permissions of file system objects. Setting 777 permissions to a file or directory means that it will be readable, writable and executable by all users and may pose a huge security risk.
chown	The chown command allows you to change the user and/or group ownership of a given file, directory, or symbolic link

Answer the following questions

- a) List the contents of a directory so that the files that have been modified most recently are displayed first

- b) List the contents of a directory so that the files that have been modified most recently are displayed last
- c) Change the current working directory to **/usr/bin**
- d) Find information for the **cut** command (man grep, press **q** to quit)
- e) Output the message **Welcome to second semester!**
- f) Create a new file named **BDSP.txt**
- g) Investigate how to create a new directory named as BDSP.
- h) Investigate how to delete a directory.
- i) Create a new file called **welcome.txt** containing some text data.

a) List the contents of a directory so that the files that have been modified most recently are displayed first

The accepted answer lists only the filenames, but to get the top 5 files one can also use:

```
$ls -lht | head -6
```

where:

-l outputs in a list format

-h makes output human readable (i.e. file sizes appear in kb, mb, etc.)

-t sorts output by placing most recently modified file first

head -6 will show 5 files because ls prints the block size in the first line of output.

```
$ls -lht
```

```
$ls -lhr
```

b)

```
$ls -lhr
```

-r means list in the reverse alphabetical order

c) Change the current working directory to **/usr/bin**

```
$cd /usr/bin
```

d) Find information for the **grep** command (man grep, press **q** to quit)

```
$man cut
```

Press **q** to quit from this command.

e) Output the message **Hello World!** (echo "Welcome back to second semester!")

```
$echo "Welcome back to second semester!"
```

f) Create a new file named as **BDSP.txt** using nano or gedit editor.

```
$nano BDSP.txt
```

```
$gedit BDSP.txt
```

g) Investigate how to create a new directory (mkdir newDirectory)

```
$mkdir BDSP
```

h) Investigate how to delete a directory (rm newDirectory if the directory contains some files, rm -rf newDirectory)

For empty directory

```
$rm BDSP
```

For directory containing files and other directories

```
$rm -rf BDSP
```

i) Create a new file called `welcome.txt` containing some text data using `cat` command. (cat welcome.txt , ctrl+D to save the text)

```
$cat > welcome.txt
```

Write any text

Press **ctrl+D** to save all above text in welcome.txt file.

j) How you display the contents of the welcome.txt file normally and backwards?

```
$cat welcome.txt
```

```
$tac welcome.txt
```

k) How to write a shell script file and provides the executable privileges?

```
$nano first.sh
```

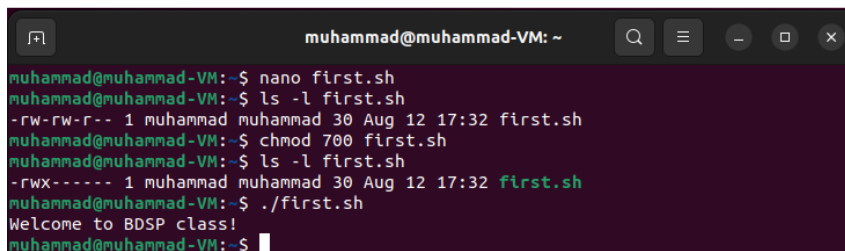

```
echo "Welcome to BDSP class!"
```

ctrl+x

and press y to save the file

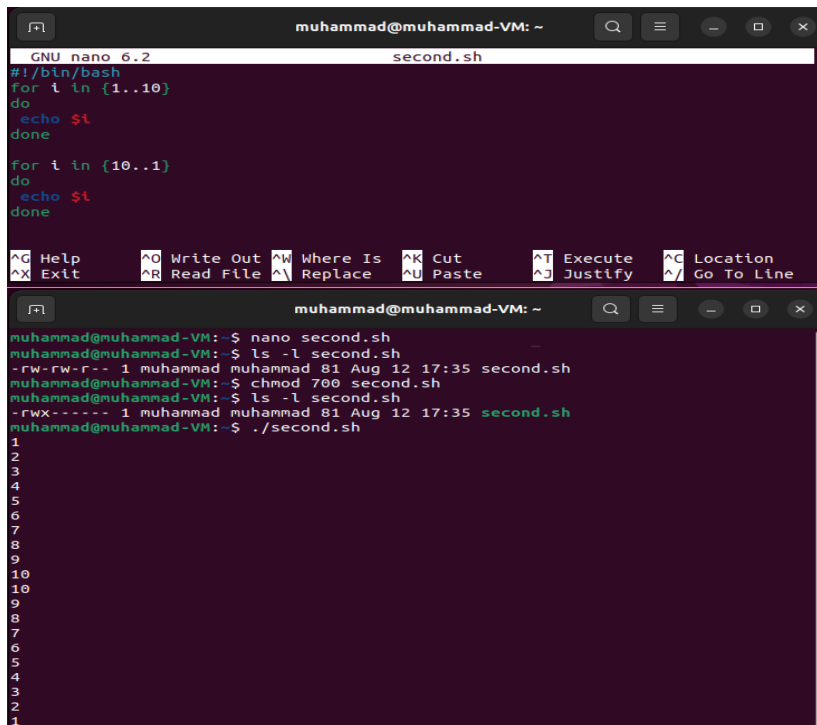

```
$chmod 700 first.sh
```

```
$./first.sh
```

A terminal window titled 'muhammad@muhammad-VM: ~' showing the steps to create and run a shell script. The user runs 'nano first.sh' to create the file, 'ls -l first.sh' to check permissions, 'chmod 700 first.sh' to set permissions, 'ls -l first.sh' to verify, and finally './first.sh' to execute it, which outputs 'Welcome to BDSP class!'.

l) Write a shell script to display the first 10 numbers in the forward and reverse order.

```
#!/bin/bash
for i in {1..10}
do
    echo $i
done
# for reverse order
for i in {10..1}
do
    echo $i
done
```

```

GNU nano 6.2 second.sh
#!/bin/bash
for i in {1..10}
do
echo $i
done

for i in {10..1}
do
echo $i
done

muhammad@muhammad-VM: ~$ nano second.sh
muhammad@muhammad-VM: ~$ ls -l second.sh
-rw-rw-r-- 1 muhammad muhammad 81 Aug 12 17:35 second.sh
muhammad@muhammad-VM: ~$ chmod 700 second.sh
muhammad@muhammad-VM: ~$ ls -l second.sh
-rwx----- 1 muhammad muhammad 81 Aug 12 17:35 second.sh
muhammad@muhammad-VM: ~$ ./second.sh
1
2
3
4
5
6
7
8
9
10
10
9
8
7
6
5
4
3
2
1

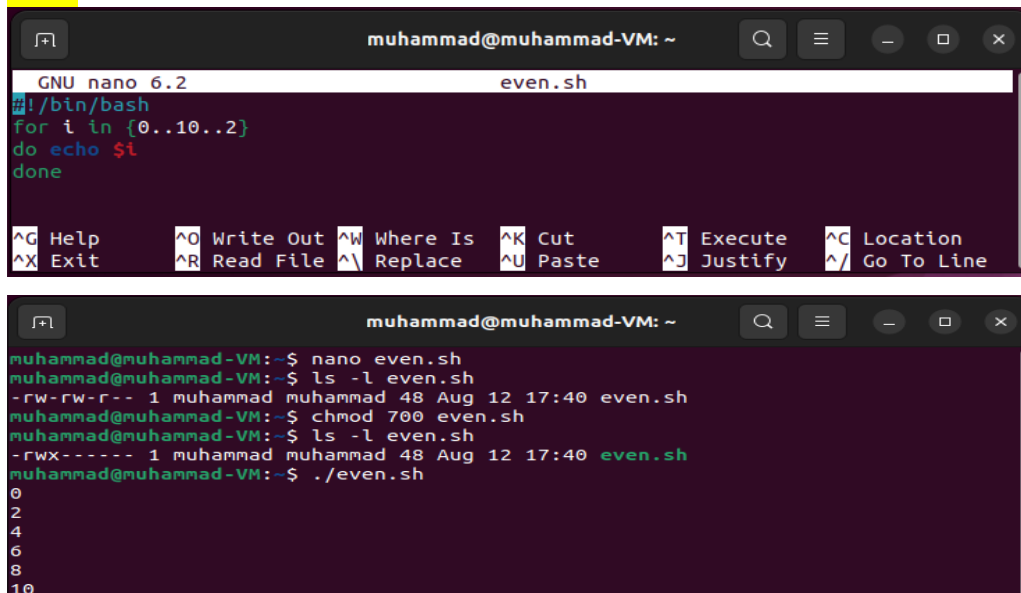

```

m) Write a shell script to display the even numbers from 0 to 10.

```

#!/bin/bash
for i in {0..10..2}
do
echo $i
done

```

```

GNU nano 6.2 even.sh
#!/bin/bash
for i in {0..10..2}
do echo $i
done

muhammad@muhammad-VM: ~$ nano even.sh
muhammad@muhammad-VM: ~$ ls -l even.sh
-rw-rw-r-- 1 muhammad muhammad 48 Aug 12 17:40 even.sh
muhammad@muhammad-VM: ~$ chmod 700 even.sh
muhammad@muhammad-VM: ~$ ls -l even.sh
-rwx----- 1 muhammad muhammad 48 Aug 12 17:40 even.sh
muhammad@muhammad-VM: ~$ ./even.sh
0
2
4
6
8
10

```
